biological agents

Published On: 08-06-2024

Researchers have found two antlion species for first time in India, Thailand and Vietnam.

They are Pseudoformicaleo nubecula and Creoleon cinnamomeus and were found in Kerala.

About Antlion: Belong to family of insects. Comparison with damselflies: Although both have morphological resemblance, antlions are distinguished by their long, distinct antennae.

Ecological Significance: Being carnivorous, they serve as biological agents to destroy the harmful pests.
