Successful test-firing of first Long-range Hypersonic Missile

Published On: 18-11-2024

Context:

India achieved a significant milestone with the successful test-firing of its first *Long-range Hypersonic Missile* off the Odisha coast. This development marks India as the fourth country, after the US, Russia, and China, to possess such advanced hypersonic technology.

Key Features of the Test:

- **Range**: The missile has a range of over 1500 kilometers.
- **Technologies Demonstrated**:
- *Aerodynamic Configuration*: To ensure stability and control during hypersonic maneuvers.
- *Scramjet Propulsion*: This allows ignition and sustained combustion at hypersonic speeds, using the vehicle's forward motion to compress incoming air.
- *Thermo-Structural Characterization*: Ensures the missile can withstand the extreme heat and pressure of hypersonic flight.
- *Separation Mechanism*: Effective at high velocities, ensuring reliable deployment during flight.

Hypersonic Technology:

Hypersonic missiles are capable of reaching speeds above Mach 5 (five times the speed of sound). Their extreme velocity and ability to maneuver mid-flight make them particularly difficult to detect or intercept, posing significant strategic advantages.

India's Existing Missile Systems:

India already has a robust array of missile systems, including:

- **AKASH** (Surface-to-Air Missiles)
- **BRAHMOS** (Long-Range Supersonic Cruise Missiles)
- **AGNI** (Long-Range Ballistic Missiles)
- **ASTRA** (Air-to-Air Missiles)
- **NAG** (Anti-Tank Guided Missiles)

The successful development of hypersonic missiles adds to India's defense capabilities, further enhancing its deterrence and strategic position.

DRDO Overview and Structure:

- **Formation**: DRDO was established in 1958 by merging the Technical Development Establishments (TDEs) of the Indian Army, the Directorate of Technical Development and Production (DTDP), and the Defence Science Organisation (DSO).

- **Leadership**: DRDO is headed by the Secretary, Department of Defence R&D, and the Director General (DG), assisted by Chief Controllers in various technology domains.
- **Technology Clusters**: DRDO has 7 technology clusters focusing on different defense areas:

1. **Aeronautics**: Unmanned aerial vehicles, avionics, combat aircraft (e.g., LCA Tejas, UAVs Lakshya, Nishant).
2. **Missiles and Strategic Systems**: Strategic and tactical missiles (e.g., Agni, Prithvi, BrahMos).
3. **Naval Systems and Materials**: Sonars, torpedoes, submarines, naval materials.
4. **Micro Electronics and Computational Systems**: Radars, avionics, AI, cyber systems.
5. **Armament and Combat Engineering**: Armaments, ammunition, tanks (e.g., Arjun tank, Pinaka MBRL).
6. **Electronics and Communication Systems**: Military electronics, communication systems, sensors.
7. **Life Sciences**: Human factors, NBC protection, life support systems.

- **Labs**: 53 specialized laboratories across India, collaborating with the Armed Forces, industry, and academia.

DRDO Mandate and Responsibilities:

- **Primary Role**: Indigenous design, development, and production of weapon systems.
- **Key Areas**: Missiles, armaments, electronics, combat vehicles, countermeasures, AI, robotics, advanced materials, NBC protection.
- **Self-reliance Goal**: DRDO focuses on enhancing India's defense ecosystem's technical capabilities, aiming for global competitiveness.

Challenges Faced by DRDO:

1. **Delays in Projects**:

- Complex projects like LCA Tejas faced long delays due to overambitious scope, technical challenges, and inadequate project management.

1. **Dependence on Imports**:

- Critical components and systems (e.g., jet engines, semiconductors) are still imported, limiting self-reliance.

1. **Budget Constraints**:

- DRDO's budget is only about 8% of India's defense budget, hindering long-term investments and R&D capabilities.

1. **Technological Gaps**:

- India continues to depend on foreign OEMs for critical components and technologies, especially in aerospace and electronics.

1. **Jet Engine Development**:

- India still imports jet engines for combat aircraft like the LCA Tejas.

1. **Semiconductor Shortages**:

- India's reliance on imported semiconductors affects self-reliance in electronics and defense systems.

Key Achievements:

- **Missile Systems**: Strategic (Agni, Prithvi) and tactical (Akash, BrahMos).

- **Combat Aircraft**: LCA Tejas.
- **Naval Systems**: Sonars (Humsa, Mihir), torpedoes, and submarine technologies.
- **Defense Electronics**: Radars, electronic warfare systems, communication systems.

Way Forward for DRDO:

1. **Talent Management**: Improve merit-based pay, career growth opportunities, and higher studies sponsorship to retain scientists.
2. **Academia Collaboration**: Increase joint R&D, academic partnerships, and industry-sponsored projects.
3. **Defense PSU Reforms**: Strengthen partnerships with private firms, boost R&D investment, and enhance competitiveness.
4. **Startup Ecosystem**: Support defense startups through initiatives like iDEX, DIStAC, with funding, infrastructure access, and relaxed procurement norms.

DRDO plays a crucial role in India's pursuit of self-reliance in defense technologies. With proper strategy, investment, and collaboration, DRDO can overcome its challenges and contribute significantly to India's defense autonomy and global standing in defense technologies.
